### WHY NATIVE MINNESOTA PLANTS?

Native plants were here long before lawnmowers, sprinklers and garden chemicals. Once established, plants native to this region are low maintenance. Native perennials build strong, deep root systems before focusing on the production of leaves, stems and flowers, resulting in plants that are sturdy and drought tolerant. Native plants are beautiful, and provide food and shelter for wildlife including bees, butterflies, dragonflies, pollinators and birds.

### MATCHING SPECIES TO LOCATIONS

It is important to match species requirements with the site features such as soil type, light conditions, moisture and drainage for the planting to be successful. [See website for more.](#)

### SITE PREPARATION

You can start now! Proper site preparation gives your plants a great head start. Removal of competitive weeds and grasses must be accomplished before planting.

### PLANT SPACING

Flats A-E include 6-packs, designed to cover about 30 to 45 square feet. Plants should be spaced 12-18 inches apart as most will spread out as they mature. A good rule of thumb: **One plant per square foot.**
